

WATER TREATMENT

WT Series WATER TREATMENT

Engineered to be efficient, compact, flexible and easy to operate. The WT series water treatment contains everything necessary for cooling tower or central chiller treatment mounted on a single, space saving panel. Information is displayed on a LCD panel.

Scale Control – Continuous monitoring of tower water conductivity in direct proportion to the concentration of dissolved solids. Once the conductivity level exceeds the predetermined limit, the bleed-off valve opens to purge dirty, scale production water from the system.

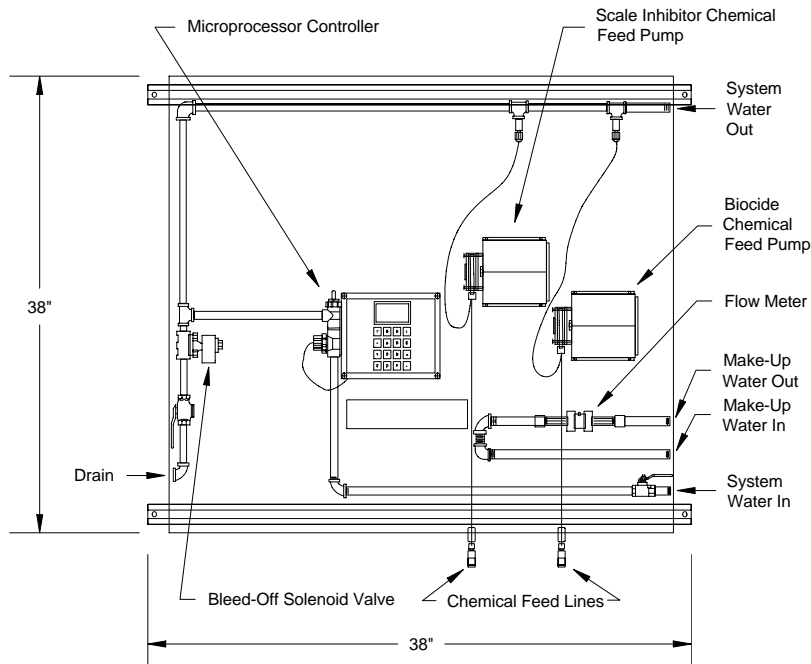

Corrosion Control – Advanced corrosion inhibitors are added in direct proportion to the volume of make-up water to protect all metals in the tower system, minimize maintenance and eliminate downtime due to corrosion related failures.

Microbiological growth control – A powerful microbicide is automatically added at timed intervals for maximum effectiveness to kill all algae-producing bacteria, assuring total system cleanliness, for hands-off, healthy control.

Suspended solids control – A self-cleaning centrifugal separator which removes suspended solids.

Warranty – Lifetime parts warranty (when H2O EWS authorized chemicals are used)
